PR 21 1914

REMARKS.

By far the most noticeable feature of the weather during January was the unusually high temperature which prevailed. The mean of means of maximum and minimum temperatures during the month was more than seven degrees higher than the normal, giving a new high record for the month at this station. The maximum and minimum for the month were both more than ten degrees higher than usual, and are the highest reached here since 1890.

The barometer was considerably higher than the normal and the range was about the usual amount.

The mean dew point was about two and one-half degrees above the normal and the relative humidity rather low.

The total precipitation was about sixty per cent of the normal and most of it occurred as rain. The snowfall was very light and soon melted leaving the ground bare most of the month.

The total wind movement was slightly more than the normal; the record by the Draper anemometer being 4659 miles. The wind records on the first and third pages of this bulletin beginning with this month are those given by a new standard electric recording anemometer instead of those of the Draper anemometer heretofore used. For light winds especially the records of the new instrument are considerably greater than those of the old instrument. The maximum velocity of wind computed from the rate for a five minute period is also given so that our records may be compared with those of other stations.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The weather during February proved to be the most seasonable of the winter. A large amount of sunshine and a small precipitation were the most noticeable features although the high mean barometer was probably the most abnormal of the various records.

A comparison of the records with those of previous years, shows the following as the most important features: The mean barometer was almost two-tenths of an inch above the normal and the maximum almost equalled the highest record of this station. The minimum was also very high giving a range considerably less than usual.

The mean temperature was about normal although both the maximum and the minimum were higher than usual. The mean dew point was more than two degrees lower than the average while the relative humidity was normal.

The total precipitation was about eighty per cent of the usual amount and more than half of it occurred during a snow storm which gradually turned to a fine hail, thus giving a large amount of water when melted.

The total wind movement was slightly less than the normal although the daily record for the 28th was one of the largest ever recorded here. The total for the month by the Draper anemometer was 4521 miles, which is but slightly smaller than the amount given by the electric register.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The weather during March was more wintry than that of January, and in some respects more than February as well. The greatest snowstorm, the largest monthly snowfall and the lowest temperature of the winter were all noted this month. The progress of the season was slow and the month closed with the season somewhat backward.

Some of the more important features of the weather elements were as follows: The mean barometer was considerably higher than the normal and the maximum was the highest March record at this station excepting that of 1904. The fluctuations of pressure were large and extended over periods of several days. The total wind movement by the Draper anemometer was 5105 miles which is slightly less than the March mean. The large amount of wind from the northwest quadrant was especially noticeable.

The mean temperature was nearly six degrees below the normal. The minimum temperature was thirteen degrees below the average March minimum and the lowest for this month on the records of this station. The maximum record was also unusually low. The mean dew point was seven degrees lower than usual while the relative humidity was practically normal.

The total precipitation was about twenty per cent more than the normal and well distributed throughout the month. Nearly one-half the amount occurred as snow. The heaviest snowstorm of the season occurred on the 15th and a second large storm on the 20th furnished the best sleighing of the winter.

A large amount of sunshine was noted and the number of cloudy days was comparatively small.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The weather during April was pleasant and seasonable. The departures from the normals of the several weather elements were small and unimportant. The large amount of wind from the North was an unusual feature. The small number of days classed as cloudy was exceptional for the season.

A comparison of the records with those of previous years shows the following features: The mean barometer was practically normal and the range about the usual amount. Large fluctuations were wanting. The high wind of the 24th was accompanied by but little change in the pressure at this station.

The mean temperature was practically normal while the maximum was about five degrees lower than usual. The mean dew-point was practically normal while the relative humidity was rather high.

The total precipitation was slightly more than the average and most of it occurred before the middle of the month. The snow and rain storm of the 9th-10th was the heaviest of the month.

The total wind movement was about ten per cent less than usual, the Draper record being 4463 miles.

The month closed with the roads in good condition and the season about normal.

REMARKS.

The weather during May was generally seasonable and was marked by no unusual features of especial interest. A few unusually warm days near the middle of the month and a couple of cool days near the close of the month were perhaps the most noticeable features.

A comparison of the records with those of previous years shows the following characteristics of the several weather elements. The mean barometer was normal and the range was considerably more than usual. The fluctuations in pressure were generally slow and unimportant.

The mean temperature was slightly lower than usual and the maximum and minimum were both above the average records. The maximum record was made considerably earlier than usual in the month. Several frosts were noted but the only one causing damage occurred on the 11th, too early in the month to cause great damage.

The mean dew point was slightly lower and the relative humidity considerably higher than usual.

The total precipitation was about forty per cent. more than normal. About two-thirds of it occurred during the heavy storm of the 27th-29th.

The total wind movement was considerably less than usual although a number of light gales occurred.

The number of hours of bright sunshine was large and but few cloudy days were noted.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The weather during June was seasonable and no characteristics of especial interest were manifest.

The mean barometer was a little lower than usual while the maximum and minimum were both normal. From the 4th to the 14th the change in pressure was a little more marked than during the other parts of the month. The wind was more variable than usual, only a few points of the compass having as much as ten per cent of the total for the month. The total wind movement by the electric register was unusually small. This record however was less than it should be owing to friction in the anemometer which was not eliminated until about the close of the month. The record by the Draper anemometer was 2387 miles. The Draper record for May which was not given on the May bulletin was 4451 miles. No gales were noted during the month.

The mean temperature was practically normal although both the maximum and minimum for the month were a few degrees lower than usual. Frost was reported in places on the morning of the 12th, although none was noted near the station.

The mean dew point was slightly higher than usual and the relative humidity about seven per cent more than normal.

The total precipitation was about seventy per cent of the normal and fairly well distributed. Only three cloudy days were noted.

J. E. OSTRANDER. Meteorologist.

T. A. BARRY, Observer.

METEOROLOGICAL OBSERVATORY

OF THE

Hatch Experiment Station,

MASSACHUSETTS AGRICULTURAL COLLEGE,

AMHERST.

Latitude, 42° 23′ 48.5″ N. Longitude 72° 31′ 10″ W.

Height of barometer above ground, 51 ft. Above sea level, 273.5 ft.

Height of Wind Instruments 72 ft.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The weather during the month was more uncomfortable than usual although there were no excessively hot days. This was due to the large number of days having a high relative humidity and the general sultriness of the air. Thunder storms were generally prevalent after the middle of the month.

The mean barometer was nearly normal and the range was rather large for the time of year. The fluctuations were generally small except near the beginning and the end of the month when considerable variation was noted. The prevailing direction of the wind near the south point was unusual for this station. The total wind movement was a little greater than usual.

The mean temperature was slightly higher than the normal while the maximum was unusually low. The range was small. The mean dew point was higher than normal and the relative humidity was nearly ten per cent. above the average.

The total precipitation was about seventy per cent. of the July mean. The rain was well distributed through the month. The amount of cloudiness was less than the normal and two-thirds of the days were recorded as fair.

REMARKS.

The weather during August was of the same general character as that of July, the predominating features being the high humidity and numerous thunder storms. The week beginning with the 12th was, however, an exception to the general character of the month, the days being clear and pleasant. The precipitation was much greater than during July, as the thunder storms were much more severe.

The mean barometer was slightly higher than the normal, while the maximum and minimum were nearly the usual records. The total wind movement was about 15 per cent more than usual, although not a single gale was noted. South wind predominated, as during July.

The mean temperature was about three degrees above the normal, the maximum was normal and the minimum was high, giving a smaller range than usual. The relative humidity was higher than any previous August record at this station, and slightly higher than the abnormal record of the previous month. The mean dew point was also unusually high.

The total precipitation was about two inches more than the normal, and much of it was accompanied by thunder and lightning. The storm on the 21st was made up of a number of distinct showers, and the thunder and lightning was the most severe of the season.

The percentage of cloudiness was considerably less than usual.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The weather during September was generally pleasant. The most noticeable features were the large amount of sunshine and the small amount of precipitation. The month also proved to be somewhat warmer than usual.

An analysis of the records for the month shows the following features: The mean barometer was slightly above the normal and the range rather large. The total wind movement was about a third more than the normal but not a single gale was noted.

The mean temperature was about three and one-half degrees higher than the normal, and the maximum of 91° on the 18th was the highest record for the season. The minimum was slightly lower than usual giving a large range for the month. A moderate frost was noted on the morning of the 25th but the damage resulting was slight.

The total precipitation was about sixty per cent of the normal and nearly all of it fell during the last third of the month. There were but five cloudy days during the month.

The mean dew point and relative humidity were both slightly higher than the usual September records.

REMARKS.

The weather during October was generally pleasant the first part of the month and rather cold and cloudy the last part. Several heavy rains, a high relative humidity, and a number of windy days were the most noticeable features.

The mean pressure for the month was slightly above the average and the range was unusually large for the season, as a result of a high maximum and low minimum. The wind direction was more variable than usual and the total movement about ten per cent more than normal.

The mean temperature was nearly normal and the maximum and minimum records about the usual figures. On a number of dates, however, the daily range was unusually large. A number of frosts were noted; those on the mornings of the 12th and 13th being the most severe.

The mean relative humidity was more than ten per cent higher than the normal while the mean dew point was but little above the average.

The total precipitation was more than sixty per cent above the normal and yet the number of stormy days were few. Nearly the whole amount fell during the heavy rains of the 9th, 20th and 25th. On the first of these dates there was thunder and lightning. About the usual amount of sunshine was noted.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The first third of the month was marked by cool, clear days. The remainder of the month was generally cloudy, and numerous light rains occurred. A considerable snowfall on the 15th was unusual for this station. The most abnormal features were the large amount of wind, small precipitation and high minimum temperature.

Comparing the record with those of former years the following features are noted: The mean barometer was practically normal and the maximum was low, giving a range considerably smaller than usual.

The total wind movement was nearly 30 per cent more than usual, and was larger than any previous November record at this station. On three dates the daily record exceeded 400 miles—a very unusual record here. All the gales noted were from the northwest quadrant.

The mean temperature was about a degree above the normal. The maximum was slightly below the average while the minimum was 8 degrees higher than usual, giving a new high minimum record for November. The range was 10 degrees less than normal.

The mean dew point was 3 degrees below the average and the relative humidity was lower than usual.

The total precipitation was about 60 per cent of the normal. Three-fourths of it occurred on two dates in well-defined storms. The remainder was scattered over a number of days, occurring in light storms of a few hundredths only. The amount of cloudiness was less than the average.

J. E. OSTRANDER, Meteorologist.

T. A. BARRY, Observer.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The weather during January was more abnormal than would appear from the monthly means. The first half the month had but a single day whose mean temperature was lower than the mean for the month, while the last half had but two days with a mean temperature above the mean for the month. Besides the temperature record the barometric and precepitation records showed abnormal features.

The mean pressure was nearly two-tenths of an inch above the normal, and made a new high record for January at this station. The daily maximum fell below 30 inches on but one date while the daily minimum was above 30 inches on more than half the days. While the fluctuations in pressure were quite pronounced the range for the month was less than usual.

The mean temperature was about a degree below the normal. The maximum over four degress higher and the minimum nearly sixteen degrees lower than usual giving a monthly range about twenty degrees more than normal. The temperature fell below zero on seven dates. The record of—23.5 degrees on the 24th is the lowest since the station was established excepting that of Jan. 5th, 1904 when —26 was reached. The mean hourly record for the 24th was—8.0 degrees, compared with—12.7 degrees on Jan. 5th, 1904.

The total precipitation was about three-fourths the usual amount and was fairly well distributed throughout the month. The snowfall was sufficient to furnish sleighing more than half the month.

The mean dew point was about 5 degrees lower than usual and the relative humidity was about normal.

The total wind movement was about normal although on six dates the daily movement exceeded 300 miles.

The amount of sunshine was nearly normal.

J. E. OSTRANDER. Meteorologist.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The severe cold weather which began about the middle of January continued throughout the whole of February. The month proved to be the coldest February since the station was established and January 1904 is the only month on our records showing a lower mean temperature.

The mean temperature was more than seven degrees below the normal. The maximum and minimum temperatures were both nearly ten degrees lower than usual. The minimum was the lowest February record excepting that of 1898. On nine dates the maximum was above freezing and on nine dates the minimum was below zero. On but two dates was the mean hourly record above 32 degrees.

The mean baromerer was slightly higher than the normal. The maximum and minimum were both high and the range was considerably less than usual.

The total wind movement was about ten per cent more than usual and an unusually large amount was from northerly directions. The record on the 3d of 529 miles is exceptional for this location. A large number of gales were noted.

The mean dew point was lower than any previous monthly record of the station. The relative humidity was slightly above the normal.

The total precipitation was about 60 per cent of the normal, nearly all of it occurring as snow.

The amount of sunshine recorded was more than for any previous February.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The weather during March was an agreeable contrast with that of the preceding month. No zero weather occurred, the amount of sunshine was large, the snow on the ground gradually disappeared and when the month closed much of the frost had left the ground and the roads were drying in many places. The last week of the month was especially mild and pleasant.

The mean barometer was slightly above the normal and the range about the usual amount. The fluctuations were large and the minimum record was coincident with the maximum wind pressure of the month. The wind movement at that time was unusually large.

The mean temperature was nearly two degrees above the normal; the maximum record of 79.5 degrees was 2.5 degrees higher than any previous March record and nearly 20 degrees above the mean of the March maximums at this station. The minimum was nearly normal giving an extremely large range for the month.

The mean dew point and relative humidity were both practically normal.

The total precipitation was very small being only about two-fifths of the usual amount. It was well distributed throughout the month.

The total wind movement was slightly more than usual and the number of gales was small for March. The amount of cloudiness was considerably less than usual. Sleighing for light sleighs continued until the 13th.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The prospect of an early spring which the weather the latter part of March indicated, was materially changed by the weather during April. Low temperature and snow so delayed the progress of the season that the month closed with the season from one to two weeks backward.

Most of the weather elements showed abnormal conditions to a greater or less degree; those of temperature, precipitation and wind movement being the most noticeable.

The mean barometer was about one-tenth of an inch below the normal, giving a very unusual record for April. The minimum record was unusually low for this station. The total wind movement was about 40 per cent more than the normal and the large amount from the northwest quadrant had a considerable effect on the temperature for the month. On half the days of the month the daily movement exceeded 240 miles.

The mean temperature was more than four degrees below the normal and the maximum for the month was nine degrees lower than the March maximum. The minimum for the month was nearly normal giving a range considerably less than usual.

The mean dew point was three degrees lower than usual and the relative humidity about eight per cent higher.

The total precipitation was only about two-thirds the normal, more than half of it falling as snow. A total snowfall of eight inches was a very unusual feature for April. The amount of sunshine recorded was very large.

REMARKS.

The weather during May was more unseasonable than that of April, and at the close of the month the season was from two to three weeks later than usual. The slow progress of spring was principally due to low temperature and a deficiency of sunshine.

The mean barometer was slightly higher than the normal and the range less than usual. The fluctuations of pressure were generally small and rather slow.

The mean temperature was more than five degrees lower than the normal, and the maximum was over three degrees higher and the minimum five degrees lower than usual, giving an extremely large range for the month. The minimum fell below the freezing point on but three dates and moderate frosts were noted on but two dates. The interval between the minimum and maximum records of the month was less than two and one-half days.

The total precipitation was about ten per cent more than the normal and more than half of the amount fell on a single date. It was accompanied by thunder and lightning,—the only thunderstorm of the month.

The mean dew point was over five degrees below the normal and the relative humidity considerably higher than usual.

The total wind movement was about a third more than usual and the amount of cloudiness large. These two features undoubtedly materially reduced the damage from frosts.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The unseasonable weather which characterized April and May was not prominent during June. Although the first part of the month was not as warm as usual, no especially low temperature was noted. The last part of the month was marked by a number of hot days.

A comparison of the records with those of previous years, shows the following features of more or less interest: The mean barometer was slightly lower than usual and the range about normal The maximum and minimum records were both slightly below the average.

The mean temperatu.e was about two degrees below the normal; the maximum was high and the minimum low, giving a larger range than usual.

The mean dew point was over two degrees below the normal while the relative humidity was nearly five per cent higher than usual.

The total precipitation was about sixty per cent of the usual amount, most of it falling near the beginning or the end of the month. A number of thunder storms occurred during the last decade of the month.

The total wind movement was about twenty per cent more than usual although but two light gales were noted.

The amount of sunshine was sightly less than usual.

J. E. OSTRANDER Meteorologist

T. A. BARRY, Observer.

BULLETIN No. 223. JULY, 1907.

REMARKS.

The weather during July was generally seasonable and the means of the several elements showed no marked departures from the normals, excepting the mean barometer. Thunder storms were quite frequent and the one on the evening of the 20th was accompanied by a heavy gale which did a considerable amount of damage, mostly in blowing and breaking down trees in this vicinity.

A comparison of the records with those of previous years shows the following features: The mean pressure was lower than any previous July since this station was established: Both the maximum and minimum were low while the range was normal.

The temperature records were normal excepting the maximum which was lower than usual. The relative humidity was about three per cent higher than usual.

The precipitation for the month was nearly 80 per cent of the normal and was well distributed throughout the month. Much of it occurred during thunder storms.

The total wind movement was about 20 per cent more than usual. The maximum pressure during the gale of the 20th was unusually high for this station.

The amount of sunshine recorded was large and but three cloudy days were noted.

REMARKS.

The most noticeable features of the weather during August were the small precipitation, large number of pleasant days and the general absence of sultriness which so often characterizes this period. The last mentioned feature is best shown by the dew point and relative humidity records.

The barometric records were generally normal and presented no unusual characteristics. The change in pressure was small even on the days of greatest wind movement. The total wind movement was about one-third more than the normal and the large amount from the southeast quadrant was unusual for this station.

The mean temperatnre was nearly two degrees below the normal; the maximum was high and the minimum low giving a range considerably greater than usual. The record of 96 degrees reached on the 12th will probably prove to be the maximum for the year. The range of over 40 degrees on the 19th was rather unusual for this locality.

The total precipitation was only about three-tenths of the normal amount and was the smallest August record since the station was established, excepting that of 1894. The precipitation which did occur was in such small amounts that the soil was not wet to any depth, and toward the close of the month vegetation was suffering considerably on account of the drought. Notwithstanding the dry weather about the usual amount of cloudiness was noted.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The drought, which was quite marked during the last part of August, was effectually broken early in September by a rainfall of about two inches. The precipitation later in the month was augmented by a number of heavy rains, which resulted in making the total for the month more than twice the normal. A new high record for September was made, and the only monthly records exceeding that of this month since the station was established are those of July, 1897, 14.51 in.; and August, 1904, 9.09 in.

The amount of sunshine was but little more than half the normal, giving a new low record for the month for that weather element.

The mean relative humidity, while nearly seven per cent more than normal, was less than several previous September records.

The mean barometer was nearly normal and the range a little larger than usual.

The total wind movement was larger than usual although but one gale was noted.

Notwithstanding the small amount of sunshine the mean temperature was practically normal. The maximum was rather low and the minimum high giving a range considerably smaller than the average.

The mean dew point was normal; a very slight frost was noted in a few places on the morning of the 27th.

J. E. OSTRANDER Meteorologist.

REMARKS.

The weather during October was generally seasonable although the records for some of the weather elements showed a considerable departure from the normals. Frosts were frequent, and on a few dates ice was formed in shallow places. The ground was frozen a few mornings near the close of the month.

The rainstorm of the 27th—29th was very heavy in this section, the amount being very nearly three inches.

The mean barometer was slightly lower than usual, and nearly the whole range for the month occurred in 56 hours. The maximum and minimum records were both higher than the October average for those records.

The mean temperature was one and one-half degrees below the normal, and the maximum and minimum were both low. The temperature fell below the freezing point on 14 dates.

The mean dew point was over 4 degrees below the normal, and the relative humidity was 3 1-2 per cent. higher than usual.

The total precipitation was about one-third more than the normal, —more than one-half the total occurring during a single storm. The number of days showing precipitation was very small considering the total for the month.

The total wind movement was about one-fourth more than usual, although but one gale was noted. The amount of sunshine was slightly more than the average.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The weather during November, while generally normal, showed a few departures of considerable magnitude from the usual records for this month. The mean relative humidity record was unusually high as noted below.

The precipitation record and minimum temperature were also somewhat abnormal.

A comparison of records with those of former years, and an examination of the charts, show the following features of interest: The mean barometer was practically normal, the minimum was unusually low, giving a range considerably larger than usual. During the first week of the month the fluctuations were large and rapid; on two dates, the fall was nearly one inch during the calendar day. The remainder of the month had a number of rapid changes but of considerably less magnitude.

The mean temperature was practically normal. The maximum was more than four degrees lower and the minimum over eight degrees higher than the usual records, giving a very small range for the month.

The mean dew point was slightly higher than the normal and the relative humidity over eleven per cent above the mean, giving a new high record for that element for November.

The total precipitation was about one-third more than usual and was well distributed throughout the month. There was a wet snowfall near the end of the month, which soon melted.

The total wind movement was about ten per cent more than the normal. On eight dates, the record exceeded 240 miles, or an average of ten miles per hour. The pressure chart showed but two gales.

The amount of sunshine was practically normal.

J. E. OSTRANDER. Meteorologist.

T. A. BARRY, Observer.

BULLETIN No. 228. DECEMBER, 1907.

Meteorological Observations

AT THE

MASSACHUSETTS AGRICULTURAL EXPERIMENT STATION.

Latitude, 42° 23′ 48.5″ N. Longitude 72° 31′ 10″ W.

BULLETIN No. 229. JANUARY, 1908.

Meteorological Observations

AT THE

MASSACHUSETTS AGRICULTURAL EXPERIMENT STATION.

Latitude, 42° 23′ 48.5″ N. Longitude 72° 31′ 10″ W.

Height of barometer above ground, 51 ft. Above sea level, 273.5 ft.

Height of Wind Instruments 72 ft.

MONTHLY SUMMARY.

Pressure. In inches.

Maximum reduced to freezing,	30.26, 19th, 12 P.
Minimum reduced to freezing,	28.56, 8th, 1 A.
Reduced† maximum reading,	30.59, 19th, 12 P.
Reduced† minimum reading,	28.86, 8th, 1 A.
Mean semi-daily reduced,	29.970
Monthly range,	1.73

****Air Temperature.*** In Degrees Fahr.

Highest,	53.0, 21st, 2 P.
Lowest,	−5.5, 31st, 7 A.
Mean hourly,	25.7
Mean of means of max. and min.,	25.8
Mean sensible (wet bulb),	22.1
Monthly range,	58.5
Highest mean daily,	40.2, 21st
Lowest mean daily,	2.0, 30th
Mean maximum,	35.3
Mean minimum,	16.3
Mean daily range,	19.0
Greatest daily range,	32.5, 20th
Least daily range,	7.5, 18th

Humidity.

Mean dew point,	16.5
Mean force of vapor,	.144
Mean relative humidity,	73.8

Precipitation. In inches.

Total precipitation,	2.25
Number of days on which .01 inch or more rain or melted snow fell,	10
Total snow, in inches,	1½

* Temperature in ground shelter.

† Reduced to freezing and sea-level.

Wind.

Total movement,	7770m.
Greatest daily movement,	473 m., 27th
Least daily movement,	40m., 11th
Mean daily movement,	251 m.
Mean hourly velocity,	10.5 m

Maximum pressure per square foot, 16.0 lbs.= 56 m. per hour, 27th, 9A., S. W.

Maximum velocity for 5 minutes, 42 m. per hour 22d, 2P., W. N. W.

Prevailing Direction, West.

Summary.

West,	16 per cent.
Southwest,	13 " "
Northwest	23 " "
West Northwest	13 " "
South Southwest	13 " "
Other directions,	22 " "

Weather.

Mean cloudiness observed,	37 per cent.
Total cloudiness recorded by the Sun Thermometer,	140 hrs.=48 per cent.
Number of clear days,	12
Number of fair days,	7
Number of cloudy days,	12

Bright Sunshine.

Number of hours recorded, 154 hrs.=52%

Rain, 4th, 7th, 8th, 12th, 16th, 22d, 26th, 27th

Snow, 4th, 7th, 9th, 15th, 23d, 24th, 27th, 28th, 29th

Sleet, 7th.

Days Sleighing, None

Gales, 36 m., 4th, W.; 50 m., 5th, W. N. W.; 36 m., 7th, S. S. W.; 35 m., 8th, W.; 40 m., 14th, N. W.; 36 m., 16th, S. W.; 53 m., 22d, W.N.W.; 49 m., 24th, N.; 56 m., 27th, S.W.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS.

The weather during January, like that of the previous month was warmer than usual, although the departure from the mean was smaller. A large wind movement, large fluctuations in the barometer and a very small snowfall were other features that were prominent.

An analysis of the records shows the following as the more important characteristics: The mean barometer was below the normal, the maximum was lower than any previous January maximum at this station excepting the record for 1896, the minimum was the lowest since 1891. Three very marked periods of low pressure were noted, culminating on the 8th, 12th and 27th. The range was considerably larger than usual.

The maximum, minimum and mean temperatures were all from two and one-half to three degrees higher than the average. The records show four years with a higher mean temperature for January during the past 18 years.

The mean dew point and relative humidity were both below the normal.

The total precipitation was about two-thirds the normal amount and scarcely any of it was snow.

The total wind movement was larger than any previous January record here. The excess over the normal was about 3000 miles. On more than half the days the daily record exceeded 240 miles; a very unusual feature here. The only wind record for any month since the establishment of the station showing a greater total movement is that of March, 1896, when 8,182 miles was registered.

The amount of sunshine was considerably greater than usual.

REMARKS

The weather during February proved to be the most seasonable of the winter. Clear, cold weather predominated and the temperature fell below zero on a number of dates. Some of the changes in temperature and pressure were unusually rapid.

The records show the following as the most important features for the month: The mean barometer was higher than the normal and the range unusually large. The fall of 1.4 in. on the 1st and the recovery of 1 in. by the end of the 2nd showed an activity rarely seen at this station. The range for the month was practically equal to the mean annual range for the station. The total wind movement was the largest for February since 1896. The daily wind movement of 594 miles on the 2nd, following the sudden drop in pressure, was one of the largest records ever made here. A number of gales occurred during the first half of the month.

The mean temperature was nearly three degrees below the normal. The maximum was high and the minimum low, giving a range about eight degrees more than usual. A rise in temperature of 42 degrees in 9 hours occurred on the 25th.

The mean dew point was considerably lower than the normal ,and the relative humidity, 8 per cent higher than usual. The high humidity taken in connection with the large amount of sunshine and clear weather, gives an unusual condition in meteorology here. The amount of sunshine was about a third more than the average, partly accounted for by the extra day in the month.

REMARKS

The weather during March was generally seasonable, and most of the transition from winter to spring was effected. The snow disappeared early in the month, and a light snowfall near the middle of the month was quickly melted. At the close of the month the frost was out of the ground in places, and some of the roads well settled.

The mean barometer was well above the normal, and the maximum and minimums both slightly lower than the average.

The mean temperature was slightly higher than usual, and the maximum about six degrees higher than the average of the March maximums. The minimum was practically normal, giving a very large range for the month.

The mean dew point was nearly normal, and the relative humidity about four per cent. greater than usual.

The total precipitation was about seventy per cent. of the normal, and but little of it occurred as snow.

The total wind movement was above the average, but the gales recorded were of only moderate intensity.

The amount of bright sunshine recorded was considerably in excess of the average.

A thunder storm occurred on the 15th, and a fine auroral display on the night of the 26th.

REMARKS

The weather conditions prevailing during April were generally seasonable, although the departure from the normals for some of the elements was unusually large. The most noticeable of these were the wind movement, sunshine and precipitation records. At the close of the month the seasonal advance was slightly ahead of average conditions.

The records show the following features of interest: The mean barometer was below the normal and the range considerably larger than usual. The minimum barometer was the lowest April record since 1891.

The mean temperature was practically normal; the maximum was about 5 degrees higher than usual, while the minimum was 3 degrees lower than usual, giving an unusually large range for the month. The maximum record has only been exceeded twice in April since this station was established, and the minimum was the lowest record since 1898. Four dates have a mean hourly temperature above 60 degrees.

The mean dew point and relative humidity were both lower than usual.

The total precipitation was small, being about two-thirds of the mean. All of the rain storms were comparatively light.

The total wind movement was the most marked feature of the month. The record was the largest for any month since the establishment of the station. On half of the dates the daily records exceeded 240 miles, or an average of 10 miles per hour. Most of the gales were from the northwest quadrant.

The percentage of sunshine was large, giving an unusually large number of clear days.

REMARKS

The weather during May was generally seasonable. While the records for some of the weather elements showed considerable departures from the normals, the combined effect was not especially noticeable.

Comparing the records with those of previous years, the following features are noted: The mean barometer was practically normal while both the maximum and minimum were low. At times the change of pressure was rather rapid.

The mean temperature was about three degrees above the normal, and the maximum and minimum records were both high. The minimum temperature was above the freezing point, and only one frost occurred. It was light, and occurring early in the month, did practically no damage.

The mean dew point and the relative humidity were both high for May.

The total precipitation was about six-tenths of an inch more than usual and was well distributed throughout the month. A heavy thunder storm on the 2nd was accompanied by a small amount of hail and the lightning did some damage in the town.

The total wind movement was about thirty per cent greater than the normal, the record for the 1st being especially large for this station. All the gales were during the first half of the month

The amount of bright sunshine was considerably greater than usual.

J. E. OSTRANDER, Meteorologist

T. A. BARRY, Observer.

Errata. Bulletin No. 232, Minimum barometer readings on 1st page should read 28.98 and 29.27, and minimum for the 30th on 2nd page should read 29.27.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

Clear, warm, dry weather characterized the month of June. The large amount of sunshine and the almost total absence of rain were especially noticeable. Although the month was considerably warmer than usual the maximum temperature was above 90 degrees on but a single date.

Comparing the records with those of previous years the following features were noted : The mean barometer was considerably above the normal and the change of pressure small, giving a range less than usual. The maximum and minimum records were both high.

The maximum temperature was about normal and the minimum low, giving a range larger than usual. The mean temperature was about two degrees above the average for June.

The mean dew-point and relative humidity were both low. The low humidity made the days of high temperature less oppressive than usual.

The precipitation record was the smallest since the station was established, being in fact about one-fifth of the normal. The former low record for June was that for 1901, the amount being .87 in.

The amount of bright sunshine was nearly 50 hours greater than the next highest record and about 125 hours more than the normal. Only two days were recorded as cloudy and each of those had over four hours of sunshine. More than three-fourths of the days were clear.

J. E. OSTRANDER, Meteorologist

R. C. LINDBLAD, Observer.

BULLETIN No. 235. JULY, 1908.

Meteorological Observations

AT THE

MASSACHUSETTS AGRICULTURAL EXPERIMENT STATION.

Latitude, 42° 23′ 48.5″ N. Longitude 72° 31′ 10″ W.

Height of barometer above ground, 51 ft. Above sea level, 273.5 ft.

Height of Wind Instruments 72 ft.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The warm weather which prevailed during June was followed by even warmer weather during July. The mean temperature for the two months was practically the same as in 1901, and slightly lower than in 1894, The relative humidity for July in each of those years was lower than the record for the month just closed.

The drought of June continued until nearly the middle of July before it was broken by rain in any amount.

The mean barometer made a new high record for July at this station. The maximam and minimum records were practically normal.

The mean temperature was more than two and one-half degrees above the normal, while the maximum and minimum records were both high. A drop in the temperature of fourteen degrees in about twenty minutes during a sudden gust of wind, about noon of the 18th, was a very unusual feature here.

The mean dew point was slightly higher than usual, and the mean relative humidity, three per cent above the normal.

The precipitation was about two thirds of the normal, the heaviest rainstorm occurring near the close of the month.

The total wind movement was about ten per cent more than the normal, winds from the south predominating.

While the amount of sunshine was considerably less than for June, the amount was large, the records showing but two days classed as cloudy.

The month closed with hot weather and high humidity.

REMARKS

The weather during August was generally seasonable, abnormal features being scarcely noticed. The high temperature of the preceding two months was not continued into this, and near the close of the month several days of comparatively low temperature were noted.

The records show the following facts of more or less interest. The mean barometer was high for August, while the range and maximum and minimum records were practically normal. The fluctuations were small and generally slow, as would be expected from the daily wind movement record.

The mean temperature was two degrees lower than normal, and both the maximum and minimum records were low. In fact, the minimum record equaled the previous low August record of 37.0 degrees for 1894. Although no frost was noted at the station on the date of the low temperature, light frost was reported from a number of places in this vicinity.

The precipitation was slightly less than the usual amount and fairly well distributed throughout the month. A heavy thunder storm on the 10th was accompanied by a trace of hail at the station. In some of the adjoining towns much damage was done to the tobacco by the hail.

The mean dew point was rather low, and the relative humidity considerably higher than usual.

The total wind movement was about one-fourth more than usual, but no gales were recorded. Much of the wind was from the northwest quadrant. The sunshine record was well above the normal.

REMARKS

The most marked characteristic of the weather during September was the drought which prevailed during practically the whole month. From the 6th to the 28th, not a trace of rain was noted, and prior to that but two very small amounts were recorded. From the 1st of June until the end of September, the precipitation at this station was about four-sevenths of the normal. The accumulated deficiency for the four months was about seven and one-half inches. A large amount of hazy weather, probably due to forest fires, was also noted.

Comparing the records with those of previous years, the following are the more important features: The mean barometer was rather high and the range slightly less than usual. The fluctuations were generally small. More than the usual amount of wind was from the south points of the compass.

The mean temperature was about one and one-half degrees above the normal, while the maximum and minimum records were both close to the usual figures.

The mean dew point was slightly lower than the normal, while the relative humidity was higher than usual.

The total precipitation was about 40 per cent of the normal, and over three fourths of it occurred during a single shower near the close of the month.

The total wind movement was more than the September mean.

The number of cloudy days was very small, and the amount of sunshine considerably more than usual. An unusually fine display of "Northern lights" was noted on the evening of the 29th.

REMARKS

The most pronounced feature of the weather during October was the continuation of the drought. The deficiency in precipitation from the first of June, noted in the last bulletin, was augmented during October by more than two inches, so that the last five months show an accumulated deficiency of nearly ten inches. The total deficiency so far for the year is twelve inches, or nearly one-third of the normal amount. Both the temperature and barometer records were considerably above the normal.

The records, compared with those of previous years, show the following features: While both the maximum and minimum barometer records were nearly normal, the mean pressure was more than a tenth of an inch above the normal. The maximum record was above 30 inches for the first 28 days, showing comparatively little activity for that period. The total wind movement was about ten per cent less than usual, and the amount from the southeast quadrant was unusually large.

The mean temperature was about a degree and a half above the normal and the difference between the mean of maximum and minimum and the mean hourly considerably larger than usual.

The maximum record was above 90 degrees for the first time for October since this station was established. This record was about 12 degrees higher than the average October maximum. The minimum record was practically normal, giving an unusually large range.

The mean dew point was practically normal and the relative humidity higher than usual.

The total precipitation was hardly two-fifths of the normal, and over two-thirds of it fell during the last week of the month. The October records of .66 in. in 1892 and .73 in. in 1897, are the only ones showing a smaller amount for this month.

The amount of sunshine was slightly above the average. The first heavy frost of the season occurred on the 3d.

REMARKS

While the weather during November was generally seasonable, the records for some of the elements showed considerable departures from the normals. The most marked of the abnormal features was the small precipitation, increasing the shortage for the year considerably. A large wind movement was another prominent feature.

The temperature for the last week of the month was considerably higher than for the first week; an unusual feature for November, when the transition from autumn to winter is expected.

A comparison of the records for the month with those of former years shows the following features: The mean barometer was slightly lower than normal and the range slightly less than usual. The change in pressure was in general not especially rapid, considering the large wind movement.

The mean temperature was practically normal. The range was unusually small for November, due to a low maximum and high minimum. The minimum temperature was one of the three highest minimum records for November. The mean dew point was about normal while the relative humidity was high, due to considerable foggy weather.

The total precipitation was less than one-third the normal, more than half the amount occurring during a small snowstorm about the middle of the month.

The total wind movement was about thirty per cent. more than the average.

The amount of sunshine was nearly twenty per cent. less than the average and about half the days were cloudy.

J. E. OSTRANDER, Meteorologist

R. C. LINDBLAD, Observer.

BULLETIN No. 240. DECEMBER, 1908.

Meteorological Observations

AT THE

MASSACHUSETTS AGRICULTURAL EXPERIMENT STATION.

Latitude, 42° 23′ 48.5″ N. Longitude 72° 31′ 10″ W.

Height of barometer above ground, 51 ft. Above sea level, 273.5 ft.

Height of Wind Instruments 72 ft.

MONTHLY SUMMARY.

REMARKS

The weather during the first month of the year was generally seasonable although slightly warmer than usual. A high mean barometer and large wind movement were the most noticeable abnormal features. Thunder and lightning on the 24th seemed out of season.

A comparison of the records with the mean of twenty years for this station shows the following as the more important features for the month: The mean barometer about one-tenth of an inch above the normal while the maximum was higher and the minimum lower than usual giving a large range for the month. The total wind movement was about 25 per cent more than the normal with a large amount from the northwest quadrant.

The maximum temperature was nearly 4 degrees above the normal and the minimum nearly normal giving a large range for the month. The minimum fell below 0 Fahr. but once during the month. The mean temperature was about 1½ degrees above the normal.

The mean dew point and relative humidity were both above the normals for the month.

The total precipitation was slightly more than usual and fairly well distributed throughout the month. Less than half the total fell as snow so the total snowfall was not large. The heavy rainfall on the 5th and 6th was of much benefit in replenishing the municipal water supplies.

While there was sleighing more than half the month it was not generally good.

The amount of cloudiness observed was slightly more than usual.

REMARKS

The weather during the month, while fairly seasonable in character, was marked by sudden changes and large fluctuations in a number of the more important elements. Perhaps the most noticeable were the high temperature, large precipitation, small amount of snow and large wind movement.

A study of the records shows the following as the principal departures from the normals: The mean barometer was considerably lower than usual and the range large even for February. The minimum record was extremely low for this locality, and was reached by an unusually rapid fall,—an inch in about fourteen hours. Large fluctuations were pronounced throughout the month. The total wind movement was considerably more than the normal, and largely from the northwest quadrant.

The mean temperature was about six degrees higher than usual, and the maximum and minimum records were both high. The maximum record followed the minimum for the month, in 55 hours, giving the monthly range in an unusually brief time. The temperature fell below zero on but a single date.

The mean dew-point was about four degrees above the normal, and the relative humidity slightly higher than usual.

The total precipitation was about two inches more than the normal and well distributed throughout the month. Only a comparatively small part of it occurred as snow.

The cloudiness observed was slightly more than the average. There was sleighing about half the month, but part of the time it was comparatively poor.

REMARKS

The weather during March presented a number of features out of the ordinary when compared with former records. The most prominent of the abnormal features was the barometric record. The wind movement and range of temperature were also unusual records for the station.

Comparing the records with those of former years the following features are noted: The mean barometer made a new low record for March at this station. The minimum pressure was also lower than any previous March record here. The only mean monthly barometer for any month on our records, showing a lower pressure is that of April 1889, with a record of 29.795 inches. The minimum records for January 1891, February 1895 and 1896 and Nov. 1904 are the only lower mimimum records since the establishment of the station.

The total wind movement was large, being about thirty per cent more than the March normal. It was, however, about 1150 miles less than the highest March record.

Although the month seemed warmer than usual, the maximum temperature was more than 7 degrees lower than the normal and the minimum more than 8 degrees higher than the normal—giving the smallest range for March on our records.

The mean dew point was practically normal while the relative humidity was 7 per cent above the average.

The total precipitation was about three-fourths of the normal and over 60 per cent of the total occurred on a single date.

The amount of sunshine was considerably more than normal and the number of cloudy days comparatively few. The month closed with every indication of an early spring season.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The most marked feature of the weather during the month was the heavy wind storm on the 8th. From 8 P. M. on the 7th to 8 P. M. on the 8th the total wind movement was 705 miles as recorded by the anemometer. This exceeds any previous daily record at this station. The maximum wind pressure, while high, was considerably less than the station's high record. The wind did considerable damage to trees in the town. The total precipitation was nearly 90 per cent more than the normal and only about half an inch less than our maximum April record. On the evening of the 29th considerable snow fell but as it melted on reaching the ground it is only recorded as a trace.

Other features of interest were not so marked. The mean barometer was high and the maximum and minimum both considerably greater than the normals. Fluctuations in pressure were not especially pronounced for the time of year.

The mean temperature was but slightly less than the normal, while the maximum was higher and the minimum lower than usual, giving a rather large range. The last three days of the month were colder than the first three.

The mean dew point was practically normal and the relative humidity nearly 10 per cent more than the average record.

More than half the total rainfall occured during an especially heavy storm about the middle of the month.

The total wind movemsnt was about 30 per cent more than usual, although it was more than 1500 miles less than for April, 1908.

The month closed with the season considerably more backward than at the beginning of the month.

J. E. OSTRANDER, Meteorologist

R. C. LINDBLAD, Observer.

BULLETIN No. 245. MAY, 1909.

Meteorological Observations

AT THE

MASSACHUSETTS AGRICULTURAL EXPERIMENT STATION.

Latitude, 42° 23′ 48.5″ N. Longitude 72° 31′ 10″ W.

Height of barometer above ground, 51 ft. Above sea level, 273.5 ft.

Height of Wind Instruments 72 ft.

REMARKS

The season during May made less progress than usual, although abnormal features were not especially noticeable. Rains were frequent, although the total for the month was less than the normal. The month was slightly cooler than usual, without unusual temperatures.

Comparing the records with those of former years the principal features noted are as follows: The mean barometer was slightly below the normal, while the range was about the usual amount. The maximum temperature was about 5 degrees lower than usual, and the minimum more than 2 degrees higher than the normal, giving a comparatively small range. A few dates showed a large daily range.

The mean dew point was quite low, and the relative humidity a little greater than the normal.

The total precipitation was a little more than 10 per cent below the normal, and was well distributed throughout the month. No especially heavy rains were noted.

The tolal wind movement was about 20 per cent greater than usual, and the direction more variable than usual.

The sunshine record was slightly above the average, and but few cloudy days occurred. But one slight frost was observed during the month.

REMARKS

During June most of the weather elements showed comparatively small departures from normal values for this month. The most marked features were a light precipitation and rather large wind movement. An examination of the daily temperature records shows some features not apparent from a comparison of the monthly means.

The mean barometer was practically normal and the fluctuations of pressure were slow and small. While the total wind movement was about 20 per cent more than the average, there were no especially large daily records and but a single gale was noted. The percentage of wind from the northwest quadrant was large.

The mean temperature was but slightly above the normal, and the maximum and minimum records were average values. During the first 20 days there were but two mean daily records higher than the mean temperature for the month, while the daily records for the last 10 days were all higher than the monthly mean.

The total precipitation was about 60 per cent of the normal amount and practically all of it occurred before the 19th. The last third of the month with its high temperature received no relief by showers in this vicinity.

The percentage of sunshine was high and but two cloudy days were noted.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The weather during the month was in general of midsummer type, although some of the features showed considerable departure from the mean values for July. The light precipitation and large wind movement were the most noticeable departures from the normals.

The mean barometer was unusually low, in fact during the past twenty years the July mean was materially lower in but two years. The maximum for the month was practically normal. The minimum was unusually low for the time of year, in fact, lower than any previous July record at this station, giving a range in pressure about twenty per cent. more than usual. A large percentage of the wind was from the western points of the compass, and the total movement was greater than any previous July record here. The amount was about fifty per cent. more than the average.

The mean temperature was more than two degrees below the normal, while the maximum and minimum were not far from average values.

The first third of the month was generally cool, and was followed by about a week with high temperature. From the 18th to the 26th the days were fair and pleasant, while the last six days were the most oppressive of the month.

The mean dew point and relative humidity were both slightly below the normal.

The precipitation was less than one-half the usual amount, and the smallest July record since 1894. About two-thirds of the total fell during a single storm on the 16th.

The sunshine record was large, and but three days were recorded as cloudy.

REMARKS

The month was generally pleasant and seasonable with fewer sultry days than usual. Abnormal features were wanting with the exception of a heavy rainstorm about the middle of the month.

Comparing the records with the twenty years' summary just published the following features are noted: The mean pressure was slightly higher than the average and the range large for August. The maximum was slightly higher and the minimum considerably lower than normal records. The wind movement was about ten per cent. above the normal and quite variable in direction.

The maximum temperature was over three degrees above the normal and the minimum nearly five degrees lower than usual giving a range of nearly eight degrees more than the August average. The maximum record is thus far the maximum for the year. The mean temperature was slightly below the normal. The low temperature on the morning of the 31st was very close to the frost line and while no frost was noted at the station, light frost was reported from some low lands in the vicinity.

The relative humidity was practically normal and the mean dew point about two degrees lower than usual.

The total precipitation was about ninety per cent of the normal and about two-thirds of it occurred during a single storm.

The amount of bright sunshine was slightly above the average; distant thunder was noted on a single date.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The most prominent features of the weather during September were the large precipitation, comparatively small range of temperature and the absence of frost. While very light frost was observed in this vicinity on the morning of the 29th there was none at the station. Not since 1891 has the first frost of the season occurred as late as October.

An analysis of the previous records here shows the following features: The mean barometer was the highest since 1894, and the maximum and minimum records were both considerably higher than the normal, while the range was less than usual. The total wind movement was over 20 per cent. more than the normal, and the direction quite variable.

The maximum temperature was about 5 degrees lower than the September normal and the minimum record was rather high, giving a range of more than 7 degrees less than usual. The mean temperature was slightly less than normal.

The mean dew point was slightly above the average and the relative humidity about 5 per cent. greater than the normal.

The total precipitation was about ¾ of an inch more than the average. Considerably more than one half the total fell in a single storm near the close of the month.

The amount of sunshine was very nearly normal, although the last third of the month was quite cloudy.

Notwithstanding the rather large wind movement there were no gales registered.

REMARKS

The weather during October was marked by a large number of pleasant days and more than an average amount of sunshine. The small precipitation and late appearance of the first frost were also noticeable features.

A comparison of the records with those of former years shows the following features : — The mean barometer was nearly normal, the minimum pressure was rather high, giving the lowest October range for ten years. The total wind movement was about ten per cent. more than the mean, and an unusual amount was from the Northwest quadrant.

The mean temperature shows that the month was slightly cooler than usual. This feature was not noticeable on account of the general character of the days, alluded to above. The maximum and minimum temperatures were both high and the range was more than five degrees greater than usual. The first frost at the station occurred on the 13th — the latest date on our records. The only other year on our records when the first frost occurred in October is 1891, when the first frost was on the 12th.

The precipitation during the month was only one third the normal and occurred in small amounts on several dates.

The mean dew-point was lower and the relative humidity higher than the October normals.

The amount of cloudiness was smaller than usual, and the number of cloudy days correspondingly few. But one gale was recorded during the month.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The weather during November was abnormal in several of its elements, resulting in a month more pleasant than usual for the time of year. The small precipitation and comparatively high average temperature were perhaps the most noticeable features and the ones having the greatest effect.

An analysis of the several elements shows the following features of more or less interest: The mean barometer was the highest November record since 1895; the maximum and minimum were both unusually high while the range of pressure was nearly normal. Several well marked high and low points were recorded with rather rapid changes of pressure between. The total wind movement was about one-fourth more than the average as would be expected from the barometric activity.

The mean temperature as deduced from the mean of the maximum and minimum daily records was more than four degrees higher than the normal, and the maximum and minimum for the month were both several degrees above the usual records. The month was the warmest since 1902.

The mean dew point and relative humidity were both slightly higher than normal records.

The total precipitation was the same as for November, 1908, the amount being only one-third the normal. These two records are the smallest for this month since this station was established.

The last third of the month showed a number of days with large wind movement, and a considerable number of gales were recorded.

The amount of bright sunshine was about 20 per cent more than the mean.

J. E. OSTRANDER, Meteorologist

C. M. DAMON, Observer.

BULLETIN No. 252. DECEMBER, 1909

Meteorological Observations

AT THE

MASSACHUSETTS AGRICULTURAL EXPERIMENT STATION.

Latitude, 42° 23′ 48.5″ N. Longitude 72° 31′ 10″ W.

Height of barometer above ground, 51 ft. Above sea level, 273.5 ft.

Height of Wind Instruments 72 ft.

REMARKS

The weather during the month presented extreme records in a number of features, but perhaps the most prominent was the range in the records of some of the elements, especially those of temperature and pressure. The amount of precipitation was also exceptionally large.

An analysis of the several weather elements of the month shows the following features: The mean barometer was the highest in ten years, excepting only the years 1907 and 1909. The maximum was extremely high and the minimum quite low giving the greatest range since 1894. The fluctuations in pressure were generally large and rapid giving a pressure chart of large waves. As usual, high winds marked the periods of greatest fluctuations of pressure.

The mean temperature was more than two degrees above the normal; the maximum over five degrees higher than usual and occurred during a heavy rain at 3-30 A. M.—a most unusual time for such a record. The minimum was slightly lower than usual, giving the large range referred to above.

The mean dew point and relative humidity were both high as might be inferred from the precipitation and sunshine records.

The total precipitation was about eighty per cent more than the normal and well distributed throughout the month. The record was the largest since 1898.

The wind movement was large with a considerable number of gales and more than usual from the northeast quadrant.

The amount of sunshine was less than the average, giving a large number of cloudy days.

REMARKS

During the month of February good winter weather in general prevailed. Most of the records of the several elements show unimportant departures from the normals. The most noticeable feature was the large precipitation.

Comparing the records for the month with the normals at this station the following characteristics appear: The mean barometer was slightly above the normal, and the maximum and minimum were both high. The range was considerably less than the average. The changes in pressure were not rapid or especially large, except in a few instances.

The mean temperature was slightly above the normal, and the range about the usual amount. The maximum and minimum temperatures were both between two and three degrees higher than the February normal values. Three different periods of zero weather were noted, but the duration of each was comparatively short.

The mean dew point was practically normal, while the relative humidity was rather high.

The total precipitation was about 60 per cent. more than usual, and was well distributed throughout the month. The snowfall was large, and as it did not melt rapidly there was sleighing throughout the month.

The total wind movement was more than a thousand miles above the normal. While there were several dates with a large daily movement the number of gales was small.

The amount of sunshine was large, and the observed cloudiness much greater in the morning than in the evening.

REMARKS

During the month the weather was exceptionally pleasant for the time of year. With but three cloudy days during the month and those at the beginning and ending of the period, an unusually long interval of fair weather occurred.

An unusually light precipitation, in fact, the smallest for March since 1889, was a very noticeable feature; especially as nearly the whole of it occurred during the first week of the month. The transition from Winter to Spring was practically completed during the month, and when the month closed the season was about three weeks in advance of normal conditions.

The records of the various weather elements show the following features: The mean pressure was high, and the range considerably less than usual. The fluctuations were not large for this season of the year. While the total wind movement was about normal, the changes of direction were more numerous than usual.

The mean temperature was about six degrees higher than the normal, and the range considerably greater than usual. Several of the daily maximums near the end of the month were unusually high; the highest of these—78 degrees—has been succeeded but once in March during the past twenty years. The minimum for the month was nearly eight degrees above the normal. The mean dew point was nearly three degrees above the normal, and the relative humidity slightly lower than usual.

The total precipitation was about one-third of the normal, and all of it occurred as rain. There was a thunder storm on the evening of the 6th and morning of the 7th, and since that time but little precipitation has been noted.

The number of hours of bright sunshine was the largest for March on our records here. The large difference between this record and the amount of cloudiness observed is largely due to the fact that the mornings and evenings, when the observed cloudiness is taken, were much more cloudy than during the middle of the day.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The season's advance, so marked at the close of last month, was slightly checked during April. Although the month was considerably warmer than usual—in fact, the mean temperature was higher than any previous April record at this station—variations in temperature were rather marked, and some of the coolest days occurred near the end of the month. The precipitation record, following the unusually small amount of the previous month, continued light until the storm of the 25th-26th, when more than one-half the total for the month fell.

Comparing the records with the normals for the station, the following features are noted: The mean barometer was practically normal and the range unusually small for the time of year. Changes of pressure were generally small and slow. The wind directions were more variable than usual.

The mean temperature was about five degrees higher than the normal, and the maximum and minimum both a few degrees above the April normal for these records. The range was rather small.

Although the first three weeks of the month were much dryer than usual, the heavy precipitation of the last week made the total for the month slightly more than normal. The mean dew point was slightly below, and the relative humidity a little above the normal.

While the total wind movement was a little more than the average only a single gale was recorded.

The amount of sunshine recorded was unusually large and the number of cloudy days correspondingly small.

J. E. OSTRANDER, Meteorologist

C. M. DAMON, Observer.

BULLETIN No. 257. MAY, 1910

Meteorological Observations

AT THE

MASSACHUSETTS AGRICULTURAL EXPERIMENT STATION.

Latitude, 42° 23′ 48.5″ N. Longitude 72° 31′ 10″ W.

Height of barometer above ground, 51 ft. Above sea level, 273.5 ft.

Height of Wind Instruments 72 ft.

MONTHLY SUMMARY.

REMARKS

The weather during May was generally disappointing, and compared unfavorably with the exceptionally pleasant March and the agreeable conditions of April.

While the several elements show but little that is abnormal, the season's progress seems to have been considerably arrested during the month. The amount of cloudiness observed in the morning and evening was large. although there were but few days which could be classed as cloudy.

The following features are noted on comparing the records with those of previous years: The mean barometer was practically normal and the range a little more than usual. The minimum pressure was rather low and occurred on the last day of the month. The wind directions from the westerly points of the compass were more numerous than usual.

The mean temperature was practically normal and the maximum nearly three degrees lower than usual, giving a rather small range.

The mean dew point was lower than the normal, while the relative humidity was about four points above the normal.

Although a measurable amount of rain fell on more than half the days of the month, the amount of precipitation was only about 70 per cent. of the normal. The last day of the month showed the greatest precipitation, coincident with the low barometer.

The total wind movement was considerably more than the normal, but only a few moderate gales were noted.

REMARKS

The weather during June presented no marked departure from normal conditions, although, in general, records were below normal values. The departures from mean conditions were most noticeable in connection with the temperature and precipitation.

The usual comparison of the monthly records with the normals for this station shows the following features: The mean barometer was considerably lower than the normal, and the range was slightly greater than usual. The fluctuations in pressure were generally slow. Both the maximum and minimum records were considerably below the normal values.

The mean temperature was two degrees lower than usual, and the range was practically normal. The maximum temperature was nearly four degrees lower than the June normal, and the minimum was very close to the frost line, being, in fact, the lowest since 1891. The first third of the month was especially cool.

The mean dew point was rather low, while the relative humidity was three points above the normal.

The total precipitation was about one inch less than the normal. Scarcely any rain fell during the last third of the month.

The total wind movement was practically normal, and on many dates the wind was so light that no pressure was recorded. No gales were noted during the month.

The amount of sunshine was above the average, and eighty per cent of the days were either clear or fair. No thunder storms occurred in the immediate vicinity, although distant lightning was noted on two dates.

REMARKS

The weather during July was unusually dry and warm with an excessive amount of sunshine. During the entire month not a single day showed less than six hours of sunshine and consequently there were no cloudy days recorded.

An analysis of the records shows the following features characterizing the several weather elements: The mean barometer was very low and the range comparatively small. The fluctuations in pressure were generally small and slow. The total wind movement was slightly more than the mean and a large amount was from the southwest quadrant.

The mean temperature was more than two degrees higher than the normal, and was but slightly below our highest July mean. The maximum and minimum were both high while the range was about an average value. Several abnormally high daily means were noted.

The mean dew point was practically normal and the relative humidity was considerably below the normal.

The total precipitation was about forty per cent of the normal and much of it occurred during thunder storms. It was fairly well distributed throughout the month. Thunder and lightning of moderate intensity was noted on several dates.

More than half the days were clear, giving an abnormally large sunshine record.

J. E. OSTRANDER, Meteorologist

R. N. HALLOWELL, Acting Observer.

REMARKS

The weather during August presented no marked variations from normal conditions although somewhat more pleasant than usual for this period. This was due to the fact that there were but few days when the maximum temperature became oppressive. More than the usual amount of wind was from the south points and the total wind movement was rather large.

Comparing the records of the several weather elements with the mormal values for this station the following features are noted: The mean barometer was higher than any previous August here and the range was rather large. The maximum and minimum were both lower than the normal values for this month.

The mean temperature was slightly lower than the normal and the maximum and minimum for the month were both below average values, while the range was rather small.

The mean due point and relative humidity were both below the normals.

The total precipitation was slightly less than the average and nearly the whole amount fell in three well defined storms.

The total wind movement was nearly 40 per cent more than the normal, although but one moderate gale was recorded.

The amount of sunshine was practically normal and nearly all the days were either clear or fair. The number of days showing precipitation was small.

REMARKS

The weather during the month was generally pleasant, and the fluctuations in pressure and temperature were considerably smaller than usual. Usually one of the most enjoyable seasons of the year, the past month was fully up to expectations, and left but little to be desired.

Several of the features are deserving of passing notice, however, and attention is called to those following: The barometer was above the normal, and September has the highest normal of any month of the year. The range was the smallest September range on the records of this station. The changes in pressure being generally small and slow, there were no gales recorded, and the maximum wind velocity was very small.

The maximum temperature was nearly six degrees below the normal and the minimum slightly above the normal, giving the smallest range for September on our records here. The greatest daily range, however, was large.

The mean dew point was slightly lower than usual, and the relative humidity five per cent above the normal; a record rather unexpected on account of the small precipitation.

The total precipitation was about seventy per cent of the normal, and most of it occurred early in the month. At the close of the month droughty conditions prevailed.

The total wind movement was normal, and on many dates practically no pressure was recorded. The amount of sunshine was considerably above the average.

REMARKS

The weather during the month was in general a continuation of the unusually pleasant weather of the preceding month, and was marked by the same characteristics. The small precipitation was the most noticeable feature, while a large wind movement and much sunshine were other features of interest.

An analysis of the records shows the following as the principal characteristics: The mean barometer was below the normal and the range slightly less than the average value. The fluctuations in pressure were, as a rule, rather large and extended over considerable periods. The large fluctuations in pressure produced a total wind movement which was fully one-third more than the normal, and gave a number of high daily records.

The mean temperature was about three degrees above the normal; the maximum was nearly five degrees higher, and the minimum about three degrees lower than the normal values for this month, giving an unusually large range. The 5th and 6th were unusually warm days for October.

The mean dew point and relative humidity were both practically normal.

The total precipitation was only about one-fourth the mean. The rain storms were all small, so there was practically no runoff to replenish the reservoirs, already low from the drought of the previous month. The precipitation record was the smallest for October since 1897.

The amount of sunshine was unusually large, and but five cloudy days were noted.

REMARKS

The weather during the month was in general seasonable, and the transition to the winter season was about completed. Excepting a rather large wind movement and an extremely low mean barometer, the records of the various weather elements were not far from the normals.

The most marked departure from normal conditions was the mean barometer for the month. The mean was nearly one-fourth of an inch below the November normal, and .16 of an inch below any former November mean on our records. The only lower monthly means on the records here are for Feb., 1901, when the mean was 29.79, and Feb., 1902, when the mean was 29.78; the latter being our lowest record.

The maximum pressure was very low, while the minimum pressure was considerably above the average minimum, giving an unusually small range for the time of year. Although the total wind movement was 20 per cent more than usual, the changes in pressure were generally small and slow.

The mean temperature was practically normal, while the maximum was low and the minimum high, giving a considerably smaller range than usual.

The mean dew point was about 2½ degrees below the normal, and the relative humidity rather high.

The total precipitation was a little above the average, and did much to relieve the droughty condition which existed at the beginning of the month.

The daily wind movement on several dates was rather large, although but two gales were noted.

The sunshine record was not far from normal.

J. E. OSTRANDER, Meteorologist.

C. M. DAMON, Observer.

Annual Summary for 1910.

Pressure. In inches.

Maximum reduced to freezing, ... 30.53, Jan. 4th, 11 P.
Minimum reduced to freezing, ... 28.80, Jan. 29th, 5 P.
Maximum reduced to freezing and sea-level, ... 30.87, Jan. 4th, 11 P.
Minimum reduced to freezing and sea-level, ... 29.11, Jan. 29th, 5 P.
Mean reduced to freezing and sea-level, ... 30.000
Annual range, ... 1.76

***Air Temperature.** In degrees Fahr.

Highest, ... 97.0, July 24th, 3 P.
Lowest, ... —9.0, Jan. 5, 5-30 A.
Mean hourly, ... 47.4
Mean of means of max. and min., ... 47.8
Mean sensible (wet bulb), ... 42.4
Annual range, ... 106.0
Highest mean daily, ... 80.1, July 10
Lowest mean daily, ... 0.0, Jan. 5
Mean maximum, ... 53.5
Mean minimum, ... 33.8
Mean daily range, ... 19.7
Greatest daily range, ... 42.0, Mar. 29
Least daily range, ... 2.5, Jan. 25

Humidity.

Mean dew point, ... 38.3
Mean force of vapor, ...379
Mean relative humidity, ... 76.0

Wind.

Prevailing direction, ... West, Northwest

Summary.

South, Southwest, ... 13 per cent.
West, Northwest, ... 12 " "
Northwest, ... 10 " "
North, Northwest, ... 10 " "
Other directions, ... 55 " "
Total movement, ... 59.242 m
Greatest daily movement, ... 468 m., Nov. 27
Least daily movement, ... 28 m., Jan. 17
Mean daily movement, ... 162 m
Mean hourly velocity, ... 6.8 m

Maximum pressure per square foot, 15.0 lbs.=55 m. per hour, Jan. 3, 11 P., N.N.W. and Feb. 23, 11 A., W.N.W.
Maximum velocity for 5 minutes, 42 m. per hour, Dec. 30, 4 P., N.W.

Precipitation. In inches.

Total precipitation, rain or melted snow, . 36.11
Number of days on which .01 or more rain or melted snow fell, ... 117
Snow total in inches, ... 44.5

Weather.

Mean cloudiness observed, ... 54 per cent.
Total cloudiness recorded by Sun Thermometer, ... 1661 hrs.=37 per cent.
Number of clear days, ... 142
Number of fair days, ... 152
Number of cloudy days, ... 71

Bright Sunshine.

Number of hours recorded, 2793 hrs.=63 per cent

Dates of Frosts.

Last, ... May 6th
First, ... Sept. 23d

Dates of Snow.

Last, ... March 14th
First, ... Oct. 27th
Total days of sleighing, ... 53

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The weather during the month was more or less abnormal in several respects; the most noticeable departures being in the temperature and precipitation records. The general absence of snow on the ground and a large wind movement were other features of interest.

A comparison of the records of the several weather elements with the normals shows the following characteristics: The mean barometer was considerably above the normal January record while the maximum and minimum were about average records. The fluctuations in pressure were large even for this time of year although the range was practically normal.

The mean temperature was about four degrees above the normal making it an unusually warm January. The maximum temperature was normal while the minimum was about ten degrees higher than usual, owing to the absence of extreme zero weather.

The mean dew point and relative humidity were both slightly higher than the normals.

The total precipitation was about two-thirds the usual amount and practically all of it occurred as rain, and was generally distributed throughout the month.

The total wind movement was about one-fourth more than the average, the records of the last four days being especially large.

The percentage of observed cloudiness was slightly above the average.

J. E. OSTRANDER, Meteorologist.

C. M. DAMON, Observer.

REMARKS

The weather during February was the most seasonable of the winter, and departures from normal conditions were comparatively unimportant. The barometer and wind movement records showed some departure from mean values, but the effect on the weather as a whole was not noticeable.

Comparing the records with the several meteorological elements with the 20 year summary of values for this station shows the following features for the month. The mean barometer was considerably higher than the normal, and the range was the smallest, with one exception, for this month. This was due to the absence of marked periods of low pressure during the month. The total wind movement was considerably more than normal and mostly from the westerly points of the compass.

The mean temperature was normal, although the minimum was about 6 degrees above the normal value. Zero temperature was noted on but a single date, and then only for a few hours. The maximum temperature was but slightly above the average. A range of 44 degrees in a single day was a rather unusual occurrence.

The mean relative humidity was practically normal, while the mean dew point was nearly two degrees below the average.

The total precipitation was about two-thirds the normal, and nearly all of it occurred as snow. Sleighing began on the 4th and continued until the 26th.

The amount of cloudiness was in excess of the usual values.

J. E. OSTRANDER, Meteorologist.

C. M. DAMON, Observer.

REMARKS

The weather during the month was seasonal to an unusual degree, and was marked by rapid changes in temperature and pressure which had their effect on the other weather elements. Many gales were noted, and snow, hail, sleet, rain and thunder and lightning all found a place on the records. Notwithstanding the great variety of the weather the month closed with the season somewhat backward.

The mean barometer of the month was slightly lower than the normal and the range of pressure was greater than any March record in our twenty years' summary. The minimum barometer equalled the previous low records of March, 1899 and 1902. The barometer chart showed large waves of pressure and rapid changes throughout the month.

As would be expected from the barometric record the total wind movement was exceptionally large, in fact, the largest March record; excepting that of 1896.

The mean temperature was two degrees lower than the normal and the maximum and minimum records both slightly lower than the average values. While the range was practically normal, the greatest daily range of 44 degrees on the 26th was very unusual here: especially as the total change occurred in a period of ten hours.

The mean dew point was about four degrees lower than the average while the relative humidity was practically normal.

The total precipitation was slightly less than the normal and was fairly well distributed throughout the month. The snowfall was practically the same as that of the previous month but it melted soon after it fell so that there was no sleighing.

The total wind movement has already been referred to: the maximum daily movement of 605 miles was very exceptional for this locality. Nearly all the gales, which were numerous, were from the west northwest.

The amount of cloudiness given by the sunshine recorder was less than the normal for this station.

REMARKS

The weather during April was generally cold and unseasonable, and the advance of Spring was slow until near the end of the month, when a few unusually warm days occurred. High barometer, much sunshine and small precipitation were also important features which had their effect on the general character of the weather.

An analysis of the several weather elements shows the following as the more important features: The mean barometer was the highest for April since 1896, when about the same record was made. The maximum and minimum pressures were both unusually high records, giving a range about equal to the normal value for that element. The maximum record was the highest ever reached in April since the station was established.

The mean temperature was about two degrees lower than the normal, and marked the month as a "cold April." The maximum temperature was about seven degrees higher than the normal April maximum, and was only 2½ degrees lower than our highest record for this month at this station. For three consecutive days near the end of the month the temperature rose to 80 degrees or above—a very unusual occurrence so early in the season.

The minimum temperature was about three degrees below the normal, giving the largest range for April on our records. The mean dew point was extremely low and the relative humidity slightly below the normal.

The total precipitation was about an inch less than usual, and nearly one-half of it occurred as snow. Two snow storms of considerable amount occurred during the first decade—a very unusual feature here. The last three weeks of the month had but little precipitation.

The total wind movement was about ten per cent more than the normal. The pressure chart showed but two gales, and they were of little severity.

The number of clear days was large and the amount of sunshine much above the normal.

J. E. OSTRANDER, Meteorologist.

C. M. DAMON, Observer.

REMARKS

The weather during May was unusual in several respects; the most important features which showed marked departures from normal conditions were the temperature and precipitation records. The mean temperature for the month was higher than any previous May record at this station, and the precipitation was unusually small. The accumulated deficiency in precipitation from the first of the year to the end of May was 5.70 inches.

Comparing the monthly records with normal values, the following features are noted: The mean barometer was unusually high for the time of year, and the range of pressure was considerably more than the usual amount. Fluctuations in pressure, however, were not generally rapid.

The mean temperature was about five degrees above the normal—an exceptionally large departure for this weather element—and was less than three degrees under the June normal. The maximum temperature, on the 22d, equalled the previous high May record, made in 1896. The minimum record was about three degrees lower than usual, giving an exceptionally large range for the month. On four different days the maximum temperature was higher than the normal maximum value for May.

The mean dew point and relative humidity were both considerably higher than the normal values.

The total precipitation was slightly more than one-third of the normal, and about one-fourth of it fell on the last day of the month. The May records of 1899, 1903 and 1905 were smaller than the amount recorded this month.

The total wind movement was about ten per cent more than the normal, and much more than usual was from the South. Only two light gales were recorded. Much more than the usual amount of sunshine was recorded, and nearly one-half the days were clear. The last frost occurred early in the month.

J. E. OSTRANDER, Meteorologist.

C. M. DAMON, Observer.

REMARKS

The weather during the month was generally pleasant with comparatively few cloudy days. High temperature was but little in evidence although the weather could hardly be called cool. A light precipitation was perhaps the most abnormal feature.

A comparison of the several weather elements with the normals for this station shows the following as the more important characteristics of the month: The mean barometer was lower than the normal and the range less than usual. Changes in pressure were generally slow and of small range, On account of the steady barometric pressure the total wind movement was small and many days did not show any apparent pressure on the wind pressure chart. The wind was from the northwest points of the compass a large part of the time. Not a single gale was registered during the month.

The mean temperature was slightly lower than the normal; the maximum was rather less than usual and the minimum above the average value giving a small monthly range. On comparatively few dates was a temperature of 80 degrees or more reached so that there was but little oppressive weather.

The mean dew point was slightly below the normal and the relative humidity slightly more than the average.

The total precipitation was about six tenths of the normal and the greater part occurred the first half of the month. The deficiency in rainfall which has been steadily accumulating since the first of the year was augmented by nearly two inches.

The amount of bright sunshine recorded was nearly twenty per cent more than the normal.

REMARKS

The excessively high temperature was easily the most important characteristic of the month just closed, and calls for more than passing comment. The temperature records of this station go back to 1889, and the records of the late Professor Snell of Amherst college carry us back as far as 1837. Previous to this year the maximum temperature record exceed 100° Fahr. but once—in 1901, when 100.5° was recorded—while on three successive days during the past month more than 100° was registered, and the highest record of 104° reached on July 4th will without doubt long remain the maximum temperature record for this station.

The mean temperature for the month, computed from the daily maximum and minimum records shows a higher value than any month since the beginning of the records in this town in 1837. The maximum and minimum records are used as being the fairest for comparison with the early temperature records.

The mean temperature for the month, as explained above, was 74.6 degrees Fahr. Other high monthly records are July, 1839, 74.4°; July, 1854, 74.1°; July, 1868, 74.0°. No other month than July has any mean temperature record as high as 72.0°. The normal mean temperature for July is slightly over 70 degrees. The mean daily records on the 3d and 4th of 86.3° and 87.0° are so exceptional that they should be especially mentioned.

The mean barometer was practically normal, and the range but little more than usual. The total wind movement was about 10 per cent more than the normal and a large amount was from the southwest quadrant.

The mean dewpoint was about normal, but the relative humidity was unusually low for July.

The total precipitation was the largest for several months, although it was more than half an inch smaller than the normal. Several good rainstorms occurred, that of the 24th being especially heavy, having nearly two inches, and almost all of it falling in less than two hours. The rain on the 28th, while not especially heavy, was of much benefit to the growing crops.

The amount of bright sunshine was exceptionally large.

J. E. OSTRANDER, Meteorologist.

R. N. HALLOWELL, Observer.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The first two weeks of the month were practically devoid of precipitation, with temperatures slightly higher than the average of the month. On the 15th a heavy rainfall occurred, which practically broke the drought which had prevailed for a considerable period. Rain fell on the 16th and 17th, and the last week was stormy most of the time. The most characteristic feature was the large precipitation.

A comparison of the records with the normals of this station shows the following features: The mean barometer was slightly higher than the normal and the range somewhat greater than usual. Fluctuations in pressure were generally small and unimportant. The total wind movement was about normal, but an unusually large number of days showed no pressure on the "Force of Wind" chart. Most of the wind was from the southwest quadrant.

The maximum temperature was nearly four degrees above the normal value and the minimum was slightly higher than the normal, giving a range a little greater than usual. The mean temperature was practically normal.

The mean dew point and relative humidity were both about normal.

The total precipitation was about forty per cent more than the average. It was the first time during the current year that the precipitation record was above the monthly normal.

The amount of bright sunshine recorded was very nearly the usual amount, but the last week was unusually cloudy.

J. E. OSTRANDER, Meteorologist.

REMARKS

The weather during the month showed no abnormal features of importance. The first frost of the season, about the middle of the month, while but a few days earlier than usual, caused considerable damage on account of its severity. Other features not so noticeable were the high relative humidity and dewpoint.

The minor departures from the normals found by comparing the records of the month with previous September records here are as follows: The mean barometer was slightly lower than the normal and the range a few hundredths less than usual. Both the maximum and minimum for the month were below average values.

The total wind movement was about 500 miles more than the September average, but no gales were recorded on the wind pressure chart. The prevailing direction of the wind was around to right of the more usual positions.

The mean temperature was about a degree below the normal and the range was the average value. The maximum temperature was about four degrees below the normal, and the minimum was nearly the same amount below the mean value of the September minima,

The mean relative humidity was about 6 points higher than the normal and the mean dewpoint about one per cent greater than the average.

The total precipitation was nearly an inch less than the September mean. No heavy storms were noted. The records show that it was fairly well distributed throughout the month.

The amount of sunshine was nearly normal.

REMARKS

The weather during the past month was marked by an unusually large amount of rainfall and an accompanying excessive percentage of cloudiness. Following a number of months showing generally a considerable deficiency in precipitation, the heavy rainfall did much toward replenishing rapidly failing water supplies and restoring the amount of ground water to nearly a normal condition. A generally high barometer, with frequent shifting of wind and a comparatively small wind movement, was also a noticeable feature.

A study of the records of the several weather elements of the month shows the following as the more important features: The mean barometer was considerably above the normal and the range of pressure less than the average value for October. While the maximum pressure was nearly normal, the minimum was considerably greater than the average minimum value.

The maximum temperature was nearly seven degrees lower than the normal value of this record for October while the minimum record was about the average value, giving an unusually small value for the range at this season of the year. The mean temperature was practically normal notwithstanding the general impression that the month was colder than usual.

While the mean dew point was rather low, the relative humidity was about five per cent above the normal.

The total precipitation was nearly two and one-half times the normal and was fairly well distributed throughout the month. The heaviest rainfall occurred during the storm of the 18th-19th when more than one-half the total for the month fell. The total was the largest October record ever made at this station, and the only monthly records showing a larger precipitation here are those of July, 1889, with a record of 10.52 inches, and July, 1897, with a record of 14.51 inches.

Combining our records with those of Professor Snell of Amherst College we find that not since 1869 has the precipitation for October been as large as during the month just closed,

J. E. OSTRANDER, Meteorologist.

H. W. ANGIER, Acting Observer.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The weather during November while generally seasonal was marked by an exceptionally large amount of cloudiness and more than average precipitation. Rather high winds and marked barometric activity were also noticeable features.

The records of the several weather elements show the following features: The mean barometer was slightly lower than the normal and the range about an average value. The changes in pressure were rather rapid at times, especially the falling barometer preceding the low points reached the 12th, 18th and 29th; the difference between the maximum and minimum on the 28th being nearly .9 inches. Accompanying the marked barometric activity was a corresponding large wind movement. On nine days the wind movement averaged more than 10 miles per hour, and on two days nearly 20 miles per hour. Most of the wind was from the western points of the compass.

The mean temperature and range of temperature were both practically normal. The fall in temperature between 7 and 8 P. M. on the 12th was 21 degrees—an exceptionally sudden change for this locality. From 7 to 11 P. M. the change in temperature was 30 degrees.

The mean dew point and relative humidity were both considerably below the normals for these elements. The total precipitation was about 20 per cent more than the November average and was distributed throughout the month.

The amount of sunshine was exceptionally small, the number of hours recorded being the least ever noted at this station for a month.

J. E. OSTRANDER, Meteorologist.

R. N. HALLOWELL, Observer.

BULLETIN No. 276. DECEMBER, 1911

Meteorological Observations

AT THE

MASSACHUSETTS AGRICULTURAL EXPERIMENT STATION.

Latitude, 42° 23′ 48.5″ N. Longitude 72° 31′ 10″ W.

Height of barometer above ground, 51 ft. Above sea level, 273.5 ft.

Height of Wind Instruments 72 ft.

REMARKS

The temperature prevailing during the month was in marked contrast with that of the previous month. While December averaged about 6 degrees warmer than the normal for that month, January was nearly 9 degrees colder than usual. The mean daily temperature gives a record almost as low as that of January, 1904,—the coldest month since this station was established. The ground has been covered with snow throughout the month and the sleighing, begun on the last day of last year, has continued without a break throughout the month.

The records of the various weather elements show the following features of interest: The mean barometer was nearly normal and the range slightly larger than usual. The minimum reduced reading was just under 29 inches and marked the culmination of the heaviest precipitation of the month. The maximum pressure was considerably below the normal for this station.

The mean temperature, as noted above, was nearly 9 degrees below the normal, and was only three-tenths of a degree higher than the record of January, 1904. The maximum was about 5 degrees lower than the average value and the minimum more than 10 degrees lower than the normal for January. Our records showing a lower temperature for January are, 1899, —21.5 degrees; 1904, —26.0 degrees; 1907, —23.5 degrees. On the 7th, 13th and 14th the mean hourly temperature was below zero—a very unusual record.

The mean dew point was about 10 degrees lower than usual while the relative humidity was several points above the normal.

The total precipitation was about 60 per cent of the normal and nearly all of it occurred as snow. The snowfall of a little more than a foot, occurred in several small storms and was well distributed throughout the month.

The total wind movement was practically normal and more than usual was from the northwest quadrant. About an average amount of sunshine was noted.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The weather during February was considerably colder than usual, although it was much less severe than that of the preceding month. With but a very light fall of snow, the low temperature preserved the sleighing during the greater part of the month. Only two storms of any amount occurred and both were mostly rain. Low barometer and very high winds were especially marked during the first of these two storms.

The records of the several weather elements show these features of interest: The mean barometer was fully a tenth of an inch lower than the normal and the maximum pressure was two-tenths less than the average of the February maximums. The minimum barometer, which was noted during the heavy storm of the 21st-22d, was one of the lowest records at this station in recent years. The pressure recovered more than an inch in the 18 hours following the time of lowest reading. The total wind movement on the two days, 22d-23d, was over a thousand miles. Much more than the usual amount of wind was from the northwest quadrant.

The mean temperature was more than two degrees below the normal and the maximum for the month was nearly 8 degrees lower than the average value for this feature. On account of this low record the range was exceptionally large. The mean hourly temperature on the 10th shows that date was the coldest so far this year.

The mean dew point was over four degrees below the normal, while the relative humidity was about the usual value.

The total precipitation was practically normal and nearly all of it occurred as rain. Moderate thunder and lightning accompanied the storm of the 21st-22d. The percentage of cloudiness was comparatively small.

REMARKS

The weather during March, while wintry and colder than the normal, was considerably less severe than that of the preceding two months. Several well defined storms occurred and the heaviest snowstorm of the winter was noted near the end of the month. The transition from winter to spring however was fairly complete at the close of the month. The most important departures from the normals were in the records for mean barometer and total precipitation.

A comparison of the records of the several weather elements with the normals for this station shows the following features of more or less interest. The mean barometer was unusually high and the range greater than usual. A number of rather large waves of pressure were recorded on the barometer chart. The large amount of wind from the northwest quadrant was unusual.

The mean temperature was over three degrees below the normal and the maximum and minimum records for the month were both well below the usual values. The range was practically normal. The mean dew point was three degrees below the normal and the relative humidity was about six points higher than the average March value.

The total precipitation was fifty per cent more than usual and most of it occurred during a few rather heavy storms.

The total wind movement was rather small for the time of year and only one gale was registered. The amount of sunshine was considerably in excess of the average amount.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The weather during April was generally devoid of unusual characteristics although it hardly can be said that the advance of the season was normal. The highest temperature and warmest day occurred early in the month and the last part of the month was rather cold. Rain occurred on more than half the days and the total precipitation was rather large. A large wind movement and comparatively few clear days were other noticeable features.

An analysis of the several weather elements gives some of the more important features as related to the normals : The mean barometer was practically normal and the maximum pressure for the month one of our highest April records. The minimum record was rather low, giving a comparatively large range. The pressure was rather unsteady giving a total wind movement nearly one-sixth more than usual.

The mean temperature was practically normal although the general impression was that the month was cold. The maximum temperature was about the normal value but the minimum was above the average giving a range less than the average value for April. The warmest day was nearly 62 degrees.

The mean dew point and relative humidity was both considerably above the normal values. Only two frosts were noted during the last decade of the month and they were both light. The season had made so little progress that they caused no damage.

The total precipitation was one inch more than the normal and was well distributed throughout the month. The heaviest storm occurred on the first two days of the month. A light snowfall was noted on the 9th. A rather heavy thunder storm occurred on the night of the 15th, and early morning of the 16th.

More cloudiness than usual was noted, as would be expected from the large number of days showing precipitation.

J. E. OSTRANDER, Meteorologist.

R. N. HALLOWELL, Observer.

BULLETIN No. 281. MAY, 1912

REMARKS

The weather during the month gave a general impression of being abnormal to an unusual degree. An examination of the records shows however that this was far from true. While there were several departures from the normal values for May, they were in no case of exceptional amount or much importance. A high dew point and relative humidity were the most marked departures from the normals.

An analysis of the records shows the following as the more important features for the month: The mean barometer and range of pressure were both practically normal and changes in pressure were generally slow and of small amount. The total wind movement was somewhat above the average and the wind directions unusually variable, only three of the sixteen directions showing ten per cent or more.

The mean temperature was slightly above the normal and the maximum and minimum records both a little higher than usual. The only frost noted was a very light one on the 1st. This date is considerably earlier than the last frost of the season usually occurs, and our records rarely show a frost after the end of May.

The mean dew point was about three degrees above the normal and the relative humidity more than ten points above the average value,—a high relative humidity being very unusual in May.

The total precipitation was a little more than one-half inch above the normal and, excepting one storm, it occurred in numerous storms of small amount. More than half the days showed a measurable amount. Two hailstorms were noted. The season however was not sufficiently advanced to have them cause much damage. Several thunderstorms occurred; two were of considerable severity.

The amount of cloudiness was a little more than usual. The month closed with the season considerably backward.

REMARKS

The weather during the month was marked by the unusually small amount of rainfall and large amount of sunshine. Not a single rain of as much as one-fourth of an inch occurred and even light precipation was recorded on but a few dates. The first half of the month was much cooler than the last half and the maximum temperature was above 85 degrees on only eight days. While heavy winds were unusual the total wind movement for the month was large.

Comparing the records with our twenty years' summary the following are the more noticeable features: The mean barometer was above the normal and the range less than the average amount. The pressure was generally steady and changes in pressure slow. Wind directions were mostly from western points of the compass.

The mean temperature was slightly below the normal and the maximum and minimum both slightly less than the usual values.

On two dates the temperature fell to 36 degrees in the thermometer shelter, and light frost was reported on low land on the mornings of both dates. No damage of consequence however was done. On account of the low humidity the warm days were generally not oppressive.

The mean dew point and relative humidity were both considerably below the normal.

The total precipitation was only about one-fifth the normal, making it one of the dryest Junes on our record. The last part of the month was practically without rainfall.

The total wind movement was about 20 per cent above the normal although but one gale was recorded.

REMARKS

The weather during July was fairly normal, excepting the rainfall. More than two-thirds of the days were fair, while the number of clear days was exceptionally small. The wind was from the South or South Southwest practically all the time until after the middle of the month, and from the North points of the compass nearly all of the last half of the month : Two-thirds of the total being from three of the sixteen points of the compass. The mean daily temperature was above the mean temperature of the month on every day from the 3d to the 17th, and below, on every day after the 16th, showing a distinct change from warm to cool conditions about the middle of the month.

The maximum barometer was nearly normal, while the minimum was rather low, giving a large range for this time of year. Fluctuations in pressure were, as a rule, not rapid. The mean pressure for the month was practically normal.

The maximum temperature of 98.5 degrees was recorded on two consecutive days. This record is more than five degrees above the July average maximum at this station. The minimum was more than four degrees lower than usual, giving a large range for the month. On three consecutive days, the 8th, 9th, 10th, the average hourly temperature was above 80 degrees.

The mean dew point and relative humidity were both below the normal values.

The total precipitation was less than 60 per cent of the normal, the greater part occurring after the middle of the month.

The total wind movement was more than the normal, but not a single gale was recorded on the pressure chart.

The amount of sunshine recorded was above the average, although but three days showed more than 80 per cent of the possible amount; the percentage necessary to have a day recorded as clear.

REMARKS

The weather during August was not as sultry as usual, and, excepting the period from the 10th to the 15th, inclusive, was generally devoid of high temperatures. About 80 per cent of the days were "fair" and only a single day recorded as "clear." The precipitation was considerably less than the average amount although a number of rains of moderate amount occurred.

An analysis of the records of the several weather elements shows the following as the principal features of interest: The mean barometer was unusually low for August and the maximum and minimum records were both below the normal values. The range of pressure was about 20 per cent greater than usual.

The total wind movement was about 20 per cent more than the normal and most of it was from the western points of the compass. Only one gale was noted and that was of only a few minutes duration.

The mean temperature was about one and one-half degrees below the normal and the maximum and minimum records were both lower than the normals for these features. The minimum of 39 degrees on the morning of the 31st was accompanied by a light frost on the college grounds. Signs of frost on earlier dates were reported in this vicinity but were not noted at the station. Less than one-third of the days had a mean hourly temperature in the "seventies."

The total precipitation was practically an inch less than the normal. Several of the storms were much less severe here than at other places in this valley. Several thunder storms occurred; the thunder and lightning on the 26th was especially marked.

The mean dew point was nearly two degrees lower than the normal and the relative humidity slightly greater than the average for August. The amount of bright sunshine was slightly greater than the normal.

REMARKS

The weather during September was much more cloudy than usual, although the precipitation was comparatively small. A high relative humidity with a correspondingly high dew point was also shown by the records. The total wind movement was small, and not a single gale was noted. The force of wind instrument showed practically no wind pressure on more than two-thirds of the days, and only four days showed a pressure exceeding one pound.

Following a trace of frost on the 31st of August, no other frost was observed until the last three days of the month, when light frosts were noted. The month closed without any damage from frost in this locality.

An analysis of the records for the month shows the mean barometer was practically normal, with a less range than usual. The maximum temperature was about two degrees below the average maximum for September, and the minimum was more than two degrees higher than the normal value for this feature, giving a comparatively small range. The mean temperature was practically normal. The last three days were decidedly the coldest of the month.

The total precipitation was about 60 per cent of the normal, and occurred as numerous small storms. Two rather heavy thunder showers were noted.

Nearly half the days were cloudy or overcast, and more than 40 hours less sunshine than usual was registered on the sunshine recorder.

REMARKS

The month just closed was marked by more than the usual amount of pleasant, agreeable weather. A small precipitation, less than the usual amount of cloudiness and many mild days, all contributed to this end. Extreme and rapid changes in the records of the several weather elements were unusual and normal conditions generally prevailed.

A comparison of the records of the month with the normal values for October shows the following as the principal features: The mean barometric pressure was practically normal and the range of pressure much less than the average at this time of year. While the maximum pressure was low, the minimum was well above the usual value for this feature. The wind movement was practically normal with no gales recorded. On only eight dates was a pressure of as much as half a pound registered on the wind pressure chart.

The mean temperature was more than three degrees higher than the normal and the maximum and minimum records were both high. The range of temperature was practically normal. The daily range on the 17th of 45.5 degrees was an exceptionally large value for this locality.

The mean dew point and relative humidity were both practically normal.

The total precipitation was but little more than one-half the normal, and about three-fourths of the whole amount occurred during a single storm on the 23d-25th. This storm however was much less severe here than at many places in the western part of this state.

The rainfall however was sufficient to partly replenish the reservoirs which were low in this section. The amount of cloudiness observed was less than the normal and only about one-third of the days were recorded as cloudy.

**Rain or melted snow at base of tower. *Included in following day.

REMARKS

The weather during the month was exceptionally pleasant, especially considering the time of year, when the transition from Autumn to Winter is usually well under way. It can hardly be said that there was a single wintry day during the month. While the precipitation was considerably more than the normal, the number of either clear or fair days was large. The last week of the month was marked by considerable high wind.

The mean barometer was lower than the normal for November, and the range somewhat less than the average value; due to a low maximum and high minimum. The maximum pressure was registered at midnight on the last day of the month.

While most of the wind was from the southwest quadrant, the heaviest gale was from the opposite direction.

All the principal temperature records were higher than the corresponding normals. The mean temperature showed an excess of more than two degrees, while the minimum record was nearly seven degrees higher than the average value for that feature.

The mean dew point and relative humidity were both slightly above normal values.

The total precipitation was about twenty-five per cent more than the normal, and all of it fell during four well defined storms. The storm on the 7th–8th was much the heaviest; one-half the total for the month occurring at that time. Traces of snow were observed on several dates, but the one noted on the 28th was the only one which perceptibly whitened the ground.

The total wind movement was nearly one-fifth more than the normal, and a number of gales were recorded on the wind pressure chart.

The number of hours of sunshine was about twenty per cent more than usual for this month. The sunshine record for the last part of the month was made with the old Draper recorder, owing to the electric recorder being out of commission. The electric recorder was started again on the last day of the month.

**Rain or melted snow at base of tower. *Included in following day.

Annual Summary for 1912.

Pressure. In inches.

Maximum reduced to freezing, ... 30.37, Mar. 6th, 1 A.
Minimum reduced to freezing, ... 28.41, Feb. 22d, 6 A.
Maximum reduced to freezing and sea-level, ... 30.70, Mar. 6th, 1 A.
Minimum reduced to freezing and sea-level, ... 28.72, Feb. 22d, 6 A.
Mean reduced to freezing and sea-level, ... 30.007
Annual range, ... 1.98

***Air Temperature.** In degrees Fahr.

Highest, . 98.5, July 8th, 3:30 P.; July 9th, 2 P.
Lowest, ... —19.0, Jan. 14th, 8:30 A.
Mean hourly, ... 46.5
Mean of means of max. and min., ... 46.9
Mean sensible (wet bulb), ... 41.6
Annual range, ... 117.5
Highest mean daily, ... 81.6, July 8, 9, 10
Lowest mean daily, ... —3.8, Feb. 10
Mean maximum, ... 57.6
Mean minimum, ... 36.2
Mean daily range, ... 21.4
Greatest daily range, ... 45.5, Oct. 17.
Least daily range, ... 4.0, Dec. 20

Humidity.

Mean dew point, ... 38.6
Mean force of vapor, ...375
Mean relative humidity, ... 77.3

Wind.

Prevailing direction, ... West

Summary.

Northwest, ... 16 per cent.
North, ... 11 " "
South, ... 10 " "
South Southwest, ... 14 " "
Other directions, ... 49 " "
Total movement, ... 55,897 m
Greatest daily movement, ... 578 m., Feb. 22
Least daily movement, ... 3 m., Feb. 17
Mean daily movement, ... 152 m
Mean hourly velocity, ... 6.3 m

Maximum pressure per square foot, 23.0 lbs.=68 m. per hour, Feb. 22d, 9 A., W.S.W.
Maximum velocity for 5 minutes, 52 m. per hour, Feb. 22d, 10 A., W.S.W.

Precipitation. In inches.

Total precipitation, rain or melted snow, . 38.56
Number of days on which .01 or more rain or melted snow fell, ... 117
Snow total in inches, ... 33.8

Weather.

Mean cloudiness observed, ... 52 per cent.
Total cloudiness recorded by Sun Thermometer, ... 2076 hrs.=46 per cent.
Number of clear days, ... 71
Number of fair days, ... 182
Number of cloudy days, ... 113

Bright Sunshine.

Number of hours recorded, 2390 hrs.=54 per cent

Dates of Frosts.

Last, ... May 1st
First, ... Aug. 31st

Dates of Snow.

Last, ... April 9th
First, ... Nov. 3d
Total days of sleighing, ... 61

Gales of 50 or More Miles Per Hour.

Jan. 9th, 62m., W.; Feb. 22d, 68m., W.S.W.; May 17th, 52m., W.; 19th, 52m., W.N.W.; Nov. 24th, 60m, E.N.E.
